See Through Walls

For some time now, Huntsville, Ala.-based Time Domain Corp. has been developing through-the-wall radar. The company's new RadarVision is a lightweight (10-pound) unit that detects movement on the other side of walls and can be used to pinpoint suspects before making an entry or to locate hidden suspects. Using RadarVision, trained officers can track the bad guys at a range of up to 30 feet through fiberglass, wood, gypsum, brick, and even concrete walls. The system is powered by rechargeable batteries and can operate for more than one hour per charge.

Time Domain's portable radar system can see through walls.
